# Additional Data

## Addresses

aggregated across properties, communities, and lat/lon information

## Police Districts

location and contact information

## Fire Companies

location information

## Community Districts

information on population, parks etc

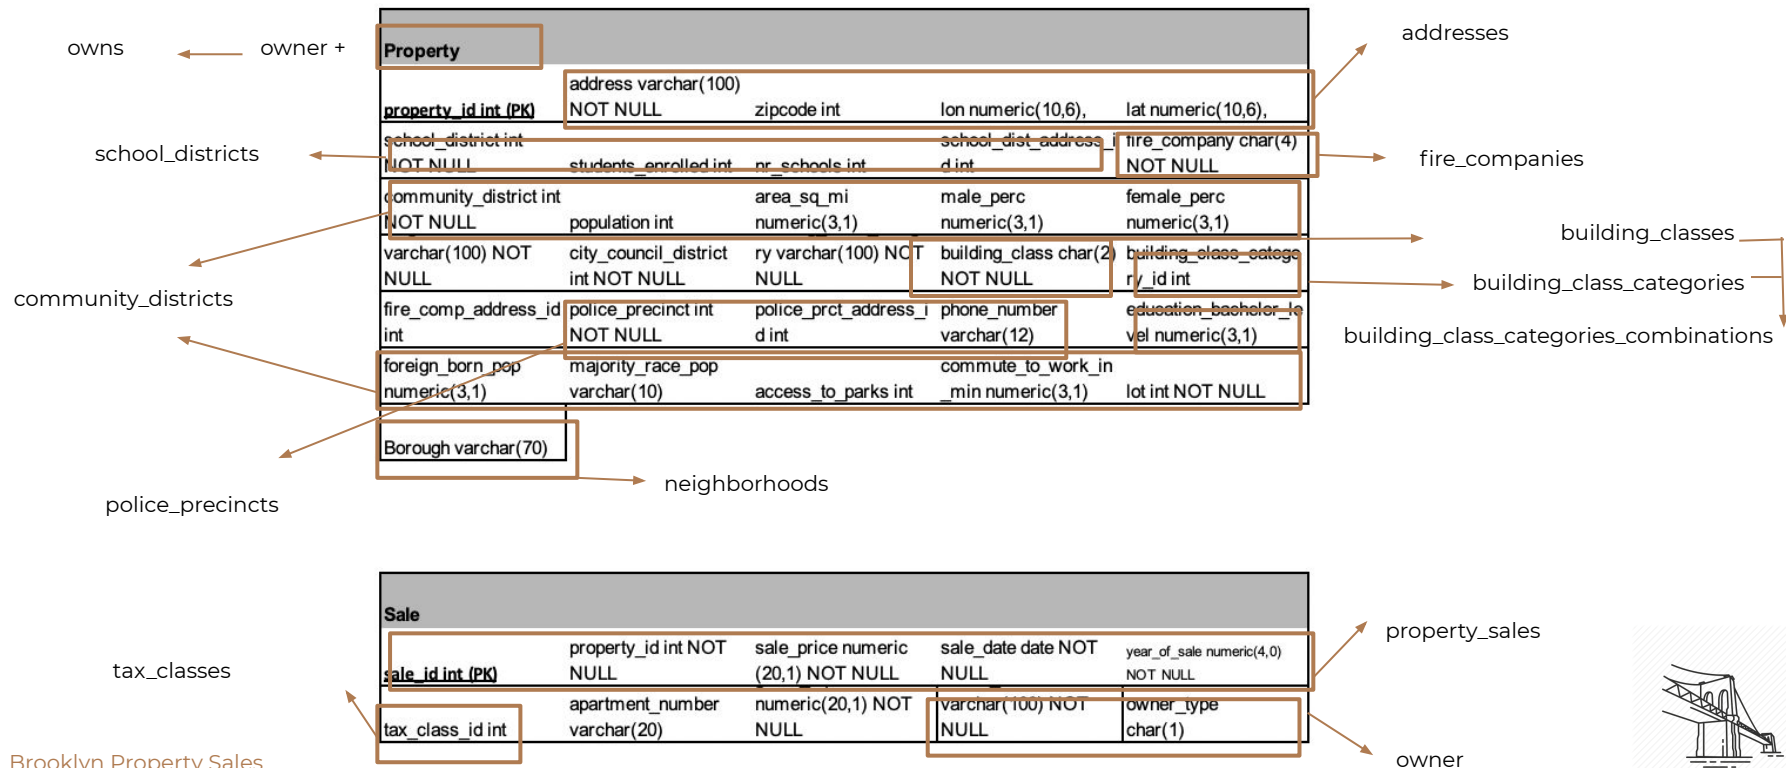

## School District

location information, nr. schools etc

# Normalization Plan

## Brooklyn Property Sales

# ETL Process

- 01 Connect to the PostgreSQL server and database
- 02 Load and inspect the data
- 03 Transform the data into necessary tables
- 04 Ingest the transformed data into the PostgreSQL database and the respective tables

[https://github.com/ergetamuca/sql\\_project\\_team4/blob/master/ETL%20Process%20-%20Brooklyn%20Home%20Sales.ipynb](https://github.com/ergetamuca/sql_project_team4/blob/master/ETL%20Process%20-%20Brooklyn%20Home%20Sales.ipynb)

# Analytical Procedures

## Analyst Level

- Analysts bring in new clients and analyze current business to refine business strategies
- Interact directly through PostgreSQL, PgAdmin and self-serve reporting capabilities on Metabase
- **Questions: What are some of the purchasing trends of owners who have purchased more than one property?**

**What is the trend of changes in sales from month-to-month?**

## C-Suite Level

- Quarterly and annual reports via a dashboard in Metabase
- Interested in high level, aggregated metrics presented in a clear way. Looking to get insight on potential investments.
- **Questions: What is the typology of neighborhoods with the highest nr of sales? What are the up and coming neighborhoods and why should we invest there?**
